

ABSTRACT

A water recycling solution for gray water is provided, which may include upper and lower water tanks placed at high and low points, respectively, of for example a building or residence. Piping and valves (which may be low pressure) may be incorporated to enable efficient low-pressure water flow throughout the system. Mechanical filters and/or traps, colorants and anti-bacterial chemicals etc. may be utilized to, for example, prevent clogging and reduce contaminants within the gray water utilized.
